ADVERSE CHILDHOOD EXPERIENCES

AMONG MICHIGAN ADULTS (2016)

What Are Adverse Childhood Experiences and How Prevalent Are They?

The Centers for Disease Control and Prevention defines adverse childhood experiences (ACEs) as “all types of abuse, neglect, and other potentially traumatic experiences that occur to people under the age of 18.” In Michigan, eight specific ACEs are tracked through an annual state-level telephone survey of adults known as the Behavioral Risk Factor Survey. In 2016, two-thirds of Michigan adults (66%) reported having one or more ACEs.

ACEs Load Matters.

Generally speaking, the higher a person’s ACEs load (the number of ACEs they have), the greater their likelihood of exhibiting risky health behaviors and experiencing poorer health outcomes. In 2016, nearly a quarter of Michigan adults reported experiencing at least one ACE, a quarter reported experiencing two to three ACEs, and nearly one in five experienced four or more.

ACEs Are Strongly Associated with Health Risk Behaviors and Poor Health Outcomes.

In 2016, 44% of Michigan adults with four or more ACEs had been diagnosed with depression, compared to only 12% with no ACEs. This trend was similar for those with chronic obstructive pulmonary disease (COPD), asthma, poor mental health, poor physical health, and poor overall health.

37% of Michigan adults with four or more ACEs reported currently smoking.

0.6M adults (9%) reported having an incarcerated household member.

2.1M adults (29%) reported substance abuse in their household.

2.7M adults (39%) reported being verbally abused one or more times as a child.

1.4M adults (20%) reported being sexually abused one or more times as a child.

1.9M adults (27%) reported having separated or divorced parents.

1.3M adults (18%) reported that they were physically abused one or more times as a child.

1.1M adults (16%) reported mental illness in their household.
46%
greater risk of binge drinking for adults with one or more ACEs compared to those with no ACEs.

82%
greater risk of poor mental health for adults with one or more ACEs compared to those with no ACEs.

83%
greater risk of diagnosed COPD for adults with one or more ACEs compared to those with no ACEs.

69%
greater risk of lifetime asthma for adults with one or more ACEs compared to those with no ACEs.

57%
greater risk of current asthma for adults with one or more ACEs compared to those with no ACEs.

64%
greater risk of fair or poor general health for adults with one or more ACEs compared to those with no ACEs.

141%
greater risk of depression for adults with one or more ACEs compared to those with no ACEs.

There Is Hope
Social support from friends, family, and the community can help buffer the negative effects of ACEs. In Michigan, adults with high levels of social support were 7% to 29% less likely to report negative health outcomes compared to those with low social support.

We Can Overcome ACEs
As a supportive adult, you can help buffer the effects of ACEs by helping to build resilience in others. Resilience means that, in the face of adversity, people can navigate life well and actively participate in preventing ACEs in the next generation.
